

# New Technology Provides Non-Surgical Options For Many People With Spinal Pain

There are new non-surgical, non-drug treatments that are changing the lives of many people with a number of painful spinal conditions. These new therapies are cutting-edge treatments that focus on decreasing pain and increasing function. Dr. Brad Shook, DC says, "Patients want drug free, non-surgical options for their back pain, and until recently they have had to travel to Charlotte for treatments like spinal decompression therapy. We have incorporated several other new therapies including lab testing for inflammatory markers so that we can address inflammatory body chemistry that could slow healing and make conditions more painful. The goal is to speed the healing process and rehabilitate spinal muscles for faster results that last longer using the latest science and technology available."

## New Technologies Include:

- **Next Generation Spinal Decompression Therapy** - Advanced, Gentle Spinal Treatment
- **Cold Laser Therapy** - Speed The Healing Process and Decrease Pain
- **Active Therapeutic Movement Rehabilitation with the ATM2** - Cutting Edge, Fast Rehabilitation Equipment
- **Blood Testing** - Detect Hidden Inflammation to Heal Faster and Decrease Pain

## Spinal Decompression Therapy

## Lab Testing

## Cold Laser

## The ATM2
